The term "nanoparticle" is not usually applied to individual molecules; it usually refers to inorganic materials. Ultrafine particles are the same as nanoparticles and between 1 and 100 nm in size, as opposed to fine particles are sized between 100 and 2,500 nm, and coarse particles cover a range between 2,500 and 10,000 nm.

In philosophy, emergentism is the belief in emergence, particularly as it involves consciousness and the philosophy of mind, and as it contrasts (or not) with reductionism. A property of a system is said to be emergent if it is a new outcome of some other properties of the system and their interaction, while it is itself different from them. Emergent properties are not identical with, reducible ...

Two organolead halide perovskite nanocrystals,  $\text{CH}_3\text{NH}_3\text{PbBr}_3$  and  $\text{CH}_3\text{NH}_3\text{PbI}_3$ , were found to efficiently sensitize  $\text{TiO}_2$  for visible-light conversion in photoelectrochemical cells. When self-assembled on mesoporous  $\text{TiO}_2$  films, the nanocrystalline perovskites exhibit strong band-gap absorptions as semiconductors. The  $\text{CH}_3\text{NH}_3\text{PbI}_3$ -based photocell with spectral sensitivity of up to 800 ...
